Cluster size distribution — 4-source pool, K=1000 partition, 1,738,094 windows
(a) Sizes span 56× but fall off gently
T-enc
T-phys
1,738 = an even partition
windows in cluster
cluster rank (largest first)
(b) Unimodal, no giant outlier
T-enc median
1,368
T-phys median
1,482
number of clusters
windows in cluster
(c) A mild head: 100 clusters hold a quarter of the pool
T-enc
T-phys
even partition
top 100 = 25%
top 10 = 3%
share of the pool (%)
number of largest clusters
(d) T-enc · random K buys ~2.5× less data per K
largest-first
random K
(median, 5–95%)
100%
10%
1%
0.1%
0.01%
windows the K clusters can supply
K (motion types the arm may draw from)
